

Fangyu HOU

Education

Master of Science in Applied Physics, City University of Hong Kong	<i>Hong Kong, China</i>
<i>Dissertation Supervisor: Xiangqiang CHU</i>	<i>Sep. 2023 – Oct. 2024</i>
Bachelor of Science in Physics, Lanzhou University <i>(One of China's key national universities)</i>	<i>Lanzhou, China</i>
<i>Specialization: Metallic Materials Physics; Undergraduate Thesis Supervisor: Dongsheng LEI</i>	<i>Sep. 2019 – Jul. 2023</i>
Selected Honor: Outstanding Student League Cadre <i>(2020 & 2021; Top 5%)</i>

Research Experience

Multimodal Olfactory Sensing and Computing	<i>Jan. 2026 – Present</i>
<i>Research Assistant, The Future Lab, Tsinghua University</i>	<i>Beijing, China</i>
- Led a cotton-smoldering early-warning study combining field investigations at two storage facilities, a five-factor AHP-based risk model, and a seven-temperature (65–215 °C) TG-FTIR-GC-MS characterization protocol to guide multimodal sensor and experimental-system design; developed the system concept underlying a Chinese invention patent application filed in July 2026. - Optimized thin-film sensing layers and electrode/substrate architectures using spin coating, layer-by-layer assembly, and ultrasonic spray coating; conducted room-temperature gas-sensing tests with an in-house four-channel electronic nose, improving NH₃ sensing from poorly recoverable single responses to reproducible sensing cycles at 10–25 ppm, while achieving measurable responses to H₂S and CH₃SH. - Co-developed E-Nose Station, an electronic-nose experimental analysis platform, developing data-acquisition interfaces for response-curve visualization, cross-experiment comparison, odor-fingerprint analysis, and model-assisted data screening; supported semi-automated experiments through software-based acquisition control, timing, and stage reminders, and applied computational olfaction methods to complex gas-sensing tasks including abnormal oral-gas identification, insect pheromone detection, and indoor pollutant-emission monitoring.	
Biomimetic Colored Radiative-Cooling Films	<i>Sep. 2025 – Dec. 2025</i>
<i>Research Assistant, Great Bay University</i>	<i>Dongguan, China</i>
Fabricated and characterized microstructured colored radiative-cooling films using vacuum deposition, UV-Vis spectroscopy, infrared/thermal imaging, nanoindentation, and microscopy; processed spectral and imaging data to compare material performance and analyze structure–property relationships among microstructure, visible appearance, optical transparency, and thermal behavior.	
GSDM Protein Dynamics and Cell Pyroptosis	<i>Sep. 2024 – Dec. 2024</i>
<i>Research Assistant, Institute of Physics, Chinese Academy of Sciences</i>	<i>Beijing, China</i>
Investigated GSDM-family protein-mediated pyroptosis using HS-AFM to visualize pore-forming dynamics, performing experiments with ThGSDM, GSDMD, and GSDME on bare mica and DOPC/DOPS supported lipid bilayers; also contributed to X-ray crystallography data processing.	
Flexible-Substrate Metasurface Optical Tweezers	<i>Mar. 2022 – Mar. 2023</i>
<i>National Undergraduate Innovation and Entrepreneurship Training Program</i>	<i>Lanzhou, China</i>
Designed flexible-substrate metasurface lenses using PDMS and nanopillar unit cells, combining FDTD simulations with MATLAB-based optical-force modeling to characterize phase response, focal fields, and three-dimensional particle trapping.	

- Modeled metasurface deformation under varying substrate stretching conditions and demonstrated stable simulated trapping of 15 nm polystyrene spheres near the self-focusing region.

Human-Centered AI Projects

Locus: Human–AI Decision Support for PhD Research Fit and Advisor Discovery
Independent Project

Apr. 2026 – Present
Beijing, China

- * Project results at [link 1](#).
- Independently designed and developed Locus, a Human–AI decision-support platform that models users’ academic backgrounds, research evidence, interests, and constraints for personalized PhD research positioning and advisor exploration.
- Built an adaptive advisor-search and ranking engine combining offline faculty retrieval, LLM-generated candidates, research-similarity scoring, and institution/discipline constraints, with dynamic search expansion under varying candidate yields.
- Designed uncertainty-aware verification mechanisms using Web, OpenAlex, and ORCID evidence, and piloted Locus with 50+ users to iteratively refine its recommendation and interaction workflows.

Skills

Programming & Data Analysis:	Python (NumPy, Pandas, Matplotlib, SciPy), MATLAB, SQLite
Web Development & Deployment:	JavaScript, HTML/CSS, Flask, Linux, Git, Nginx, Web Deployment, DNS, SSL/TLS Configuration
Scientific Computing & Engineering:	FDTD Solutions, COMSOL, SolidWorks, Arduino
Sensing & Experimental Methods:	HS-AFM/AFM, Spin Coating, Ultrasonic Spray Coating, Layer-by-Layer Assembly, Materials Characterization (Optical, Thermal, Mechanical)
